

Lead Qualification Workflow FAQ

SUPPORT QUICK REFERENCE | FRONT OFFICE & OPERATIONS | v1.0

Use this guide to answer common questions about the lead qualification workflow and identify when an issue should be escalated. The workflow assists with intake and routing; staff remain responsible for final decisions and exceptions.

Why did a lead receive "Needs Review"?

The workflow may be missing required information, contain conflicting answers, or lack enough confidence to route automatically. Review the CRM record and original submission before changing the status.

Why was a lead marked "Not Qualified"?

One or more predefined criteria were not met. Confirm the reason before closing or redirecting the lead. If the result does not match the inquiry, document the issue and escalate it.

Can I change the qualification status?

Yes. Staff may override a system-generated status when context or an exception requires it. Add a brief CRM note explaining why the status was changed.

What if the lead's information is wrong or incomplete?

Correct verified details in the CRM and gather missing information through normal follow-up. Do not guess or fill in unknown details simply to move the workflow forward.

Why did the same person create more than one record?

Check whether different email addresses were used or an existing record was created outside the normal intake process. Do not create another record; flag suspected duplicates for review.

The form was submitted, but I do not see the lead in the CRM.

Confirm the submission was completed, then search by email and phone. If the record is still missing, capture the submission time and contact details and send them to the workflow owner.

A lead's status looks wrong. Is AI making the final decision?

No. Automated and AI-assisted outputs support routing; they are not final authority. Review the source information, correct the status if appropriate, document the reason, and report recurring issues.

What kinds of inquiries should be escalated?

Escalate inquiries outside the workflow's intended scope, those with conflicting or unusual information, requests requiring an exception, or decisions reserved for an authorized team member.

What should I include in a support ticket?

Include the lead/contact name, email if available, submission date or time, current status, expected behavior, what you observed, and steps already taken. Add screenshots when useful.

Should I retry the form or create the lead manually if the workflow fails?

Avoid repeated submissions or duplicate manual records unless the documented fallback procedure requires it. Preserve the original inquiry and report the failure for investigation.

NEED HELP?
